

What is an environment?  
Joint-stress QTL circumscribe  
environmental signaling networks

Ann E. Stapleton

Biology, University of North Carolina  
Wilmington

# What is an environment?

# Why are environments important?

crossover GEI reduces prediction

Environment 1

Environment 2

If  is okay then ignore GEI.

# What makes two environments different?

Can reproduce alfalfa GEI in a common garden by using different soils in large bins.

# Stress...why yield contests have different winners

Environments of varying and variable quality

+

=

UV-drought  
synergy

# Predicting GEI: how different is different...

Are QTL found in stress environments predictive of other stress environments?

Specifically, are the gene/signaling networks the same in different stresses?

# Compared vegetative growth QTL in single and combined stress environments:

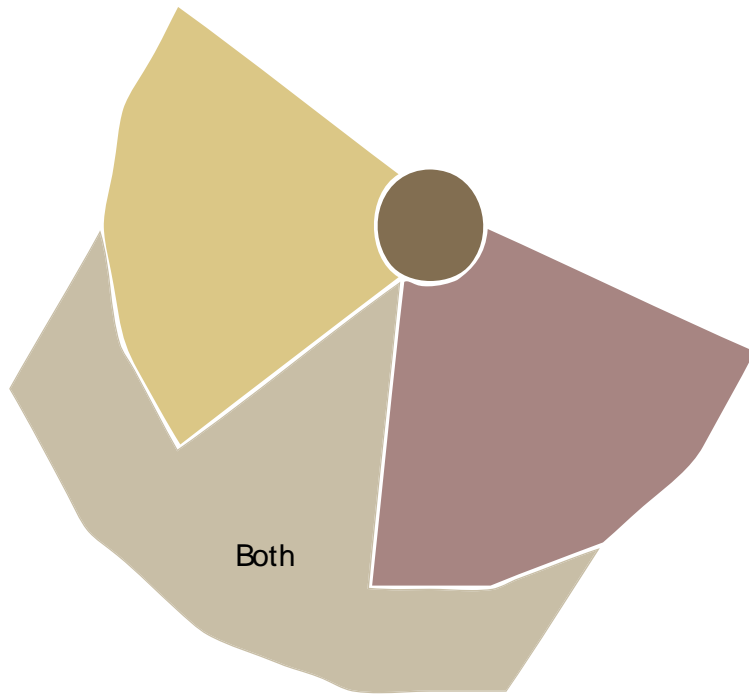

ultraviolet radiation  
drought  
both UV and drought

IBM94 RILs  
NAM RILs

# Alternative predictions of stress signaling networks (genetic architecture):

Independent signaling QTL:

Same signaling network, different allele effects:

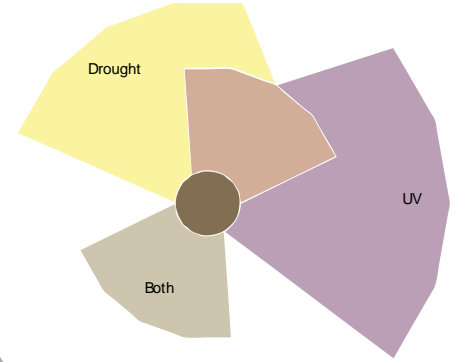

independent

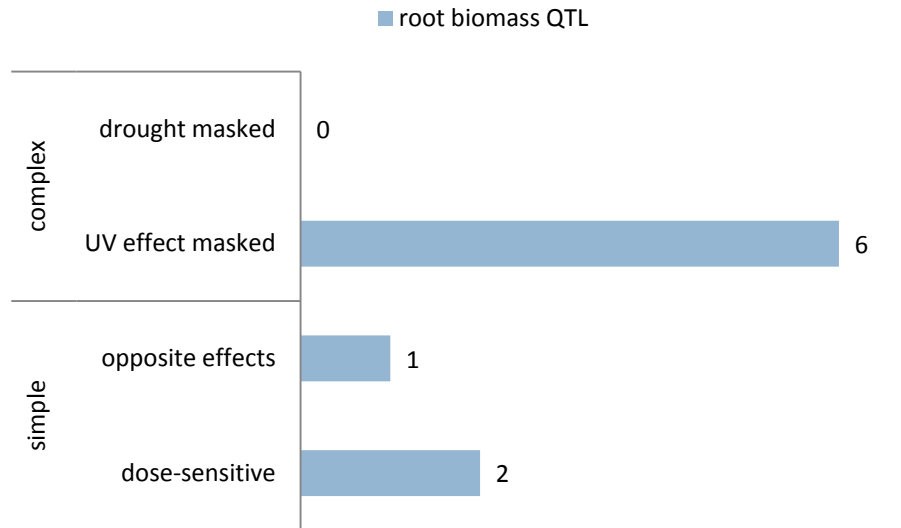

same

# IBM94 Result

# Arrangement of interacting signal QTL in IBM

Unexpected,  
as root mass  
strongly  
decreased  
under UV in  
inbreds.

## allele and background effects

For NAM population the QTL are in the same network.

Less power to detect allele-specificity, possibly more 'generic' stress pathways identified.

G x E x GEI

signaling network

G x E prediction

## Summary

Drought plus UV combined stress environment genetic architecture is quite different from the single-stress environments.

There are more interacting stress pathways.

## Coming attractions:

Candidate genes under QTL, prediction and testing of RIL intercross phenotypes

Mapping of dose-response surface parameters, to determine the “GEI vector” for the allele combinations packaged in each RIL
